

Design ideas

-Chat app (WhatsApp)

-Review app (tripadvisor)

-Food app (Deliveroo, glovo)

-Buy app (Amazon)

Review App

For this project we will be doing an app which allows users to read and write reviews about sites they have visited or are going to visit.

Screen planification

1st screen: Login screen. In this screen the user must login to the app (by google(?)). There he can also enter a link to register in case it is their first time using the app.

2nd screen: Initial screen. A screen in which the user will find the most common reviewed places/things of the last few days. Apart from that there will be a searching bar in which the user will be able to write to look for the place they want a review of. This screen will also show the results of the search done.

3rd screen: When clicking a search result, a new window will appear. In this window the user will see the name of the place, the description and the valuation of the place. All along with photos and videos. Moreover, the user will be able to see comments from other people who have visited the site.

4th screen: Options screen. This screen will be accessible at all times, and the way of accessing to it is by clicking an icon with a gear on it. This screen will show all the options that may be changed (theme of the app, allow notifications turn on/off...etc).

Screenflow

Login screen->(After logging in to google or registering)->Initial screen.

Initial screen->Options screen by clicking the options button.

Initial screen->Review screen by clicking into the searched item.

Review screen->Options screen by clicking the options button.

Options screen->Any other screen by clicking the back button of the mobile phone.
